Cavityrock® and Comfortbatt®

Effective Insulation Solutions – The Future of High-Performance Rainscreen Systems
Over 60,000 sq. ft. of ROCKWOOL Cavityrock® was installed in the Rush University Medical Center’s 14-story hospital in Chicago. (Also shown on front cover.) Rush is seeking gold leadership in energy and environment design (LEED®) certification for the new hospital. “From the beginning, it’s been designed to use water and energy efficiently and keep down waste. We’re using environmentally responsible building materials, and we’re recycling as much as we possibly can,” says Mick Zdeblck, vice president, campus transformation.*

The Building Envelope Design using ROCKWOOL

Evolution of Rainscreen Systems
The primary functions of a wall system* – to protect, facilitate, and/or provide heat, air, rain penetration, movement of moisture, fire, durability, noise, light, strength, and aesthetics – have not changed over the past 40 years. The same cannot be said for the components and design of cavity wall systems, which have undergone a significant transformation in North America.

This change in design requirements is a result of the increased code requirements that are based on changing ASHRAE standards. Increasing requirements also ask for continuous insulation (c.i.) to meet the R-value and U-value requirements of ASHRAE 90.1.

ROCKWOOL is at the forefront of developing wall systems that meet this call for higher energy efficiency, sustainability, durability and better overall performance in commercial buildings.

*Canadian Building Digest, NRC National Research Council Canada

The ROCKWOOL Difference
The R-value of ROCKWOOL insulation does not change over time because stone wool is not produced with blowing agents, which off-gas and result in lower thermal performance. Not only is the thermal performance of ROCKWOOL insulation maintained over its lifetime, but the wall system’s thermal performance is maintained because ROCKWOOL products are dimensionally stable.

ROCKWOOL insulation will not slump in stud spacing causing gaps, will not expand or contract due to temperature variances in the rainscreen system, nor is it adversely affected by the presence of moisture in the system, all of which contribute to the optimal thermal performance of a building envelope. ROCKWOOL insulation is made from stone and is non-combustible with an extremely high melting point, making it the safest insulation when compared to both fiberglass and foam plastics.

1970
All insulation in the stud wall with building paper on the exterior. No cavity wall insulation used.

1990
All insulation in the cavity with no insulation in the steel stud. High-performance air/vapor barriers used.

2010
A combination of insulation within the steel stud and cavity. Vapor permeable air barriers used.
High-Performance Rainscreen Systems

ROCKWOOL Comfortbatt® and Cavityrock®– Wall Combination

ROCKWOOL Comfortbatt®
The Comfortbatt® product line is a non-combustible, semi-rigid batt insulation range that is designed for exterior steel stud wall applications.

Comfortbatt® products are available from 2.5” to 8” in thickness and have standard R-values ranging from R10 to R32. Comfortbatt® also has a unique flexible edge designed to compress as the batt is inserted into walls, attics, ceilings and floor frames.

ROCKWOOL Cavityrock®
ROCKWOOL Cavityrock® products are non-combustible, semi-rigid insulation boards specifically engineered for exterior cavity wall and rainscreen applications.

Cavityrock® is available in thicknesses ranging from 1” to 6”, in .5” increments. The products available in 1” to 2” thicknesses are mono-density solutions, thickness of 2.5” or greater is designed using our dual-density technology. The full line of Cavityrock® products provide a thermal resistance rating of R4.3/inch.

The dual-density technology offers a high-density outer layer and a lower-density inner layer. The high-density outer layer provides greater rigidity and water repellency, while the inner layer helps to conform to architectural features leading to a truer installation.

ROCKWOOL Cavityrock® products are compatible with numerous framing systems and cladding attachment systems. This exterior insulation solution is also approved for use in many NFPA 285-compliant designs.

---

The Rainscreen System
The ROCKWOOL Wall Rainscreen System comprises ROCKWOOL thermal batt insulation in the exterior stud wall cavity (up to 6”), combined with a high-density, semi-rigid ROCKWOOL insulation board (up to 6”) in the external cavity.

ROCKWOOL insulation within the exterior wall stud cavity and the external cavity offers superior long-term thermal efficiency, fire resistance, moisture control, and acoustic performance.

Rainscreen System Zone 4-8
Components: Cladding, Air space, Cavityrock®, Permeable air barrier, Exterior gypsum board sheathing, Steel stud, Comfortbatt®, Vapor barrier, Gypsum board.

Note: In climates dominated by heating degree days (HDDs), the blue air barrier material should be vapor permeable.
Benefits to this Wall Assembly

**Dimensional Stability**
The dimensional stability of an insulation material is necessary for the faultless function of an insulation system. Dimensional changes in materials vary according to their physical properties. Thermal expansion coefficients express the rate at which materials shrink or expand when cooled or heated. ROCKWOOL insulation has a much smaller thermal expansion coefficient than organic insulation materials such as foam plastics.

Poor dimensional stability can cause shrinking, expansion, and buckling of a system’s insulation. These actions can lead to thermal bridging, waterproofing breaches, and unpredictable insulation performance.

**Long-Term Thermal Performance**
As the building industry seeks new and innovative solutions that are truly energy efficient, ROCKWOOL leads the way in developing wall systems with excellent long-term thermal performance. This is the result of two inherent properties in its insulating systems – lack of thermal loss due to dimensional changes, and the insulation’s ability to repel water, which aids in the control of heat loss and gain.

The use of Cavityrock® as a continuous insulation (c.i.) results in a wall with higher effective thermal resistance values than foam plastics.

**Water Vapor Permeance**
The water vapor permeance of ROCKWOOL insulation allows for increased potential for drying without trapping transient moisture in the assembly. ROCKWOOL Cavityrock® and Comfortbatt® are water repellent yet vapor permeable insulation products, and will allow transient vapors to pass through without restriction. Lower permeable insulations such as foam plastics can work as vapor retarders and can greatly affect the drying potential of many typical building assemblies.
Cavityrock® Black

The Future of Open-Joint Rainscreen Design
Cavityrock® Black is specially designed to mask the insulation layer in open-joint rainscreen applications, with a bonded black mat fleece facing that leaves the appearance with crisp, black lines. These aesthetic benefits come with the same excellent thermal performance, fire resistance, and moisture control that is standard with ROCKWOOL Cavityrock® insulation.

Perfect for the Job Site
Many open-joint cladding solutions use a combination of materials such as a secondary weather-resistive barrier (WRB) to mask the insulation layer, Cavityrock® Black simplifies the system by combining the insulation installation and masking in one step. This reduces the installation time and material cost to achieve the clean, distinguishable aesthetic along the façade.

Download the technical datasheet and learn more about Cavityrock® Black by visiting rockwool.com/products/cavityrock

Cavityrock® Black maintains the thermal performance of R4.3/inch and achieves a flame spread and smoke development index lower than commonly used black scrim materials. The black facing is also designed for exposure to the elements including weather, heat, and UV exposure.

Available in a variety of dimensions to meet the requirements various projects, Cavityrock® Black comes in thicknesses from 2”-6”, featuring a dual-density design in thicknesses greater than 2”.

The image above shows a view of an insulated exterior wall, one with un-faced Cavityrock®, and the other with Cavityrock® Black, installed between vertical Z-Girts.

Architects are increasingly choosing cladding façades on buildings, which, when compared to brick, tends to reduce the acoustical performance value of the wall system. With recent trends towards the use of new lightweight construction techniques and cladding materials, ROCKWOOL stone wool cavity wall insulation provides added acoustical value by outperforming traditional foam plastic insulation.

In a wall system, stone wool provides improved low frequency sound absorption to both normal and random incidents of noise. Reduced noise in the workplace can result in a more efficient and pleasant work environment for building occupants.

The stone wool fiber orientation and increased density of both Cavityrock® and Comfortbatt®, compared to other types of insulation, effectively reduce sound transmission across the wall system. Greater noise or sound control is further achieved when thicker Cavityrock®, Comfortbatt®, and gypsum board are used together.

### ASTM E90 Sound Transmission Loss Test

**Metal stud wall with exterior cladding system**

**Test Wall:** (Inside to Outside) 1/2” Gypsum, 6” Steel stud, ROCKWOOL Comfortbatt® insulation, 5/8” Gypsum board, Air/Vapor retarder, ROCKWOOL Cavityrock® insulation, 3/8” Cement board cladding.

**Metal stud wall without exterior cladding system**

**Test Wall:** (Inside to Outside) ½” Gypsum, 6” Steel stud, Gypsum board, Air/ Vapor retarder, ROCKWOOL Cavityrock® insulation, Airspace, 3/8” Cement board cladding.
ROCKWOOL Stone Wool: Fire Resistant, Non-Combustible Insulation

A key feature of ROCKWOOL products is their fire resistance. Cavityrock® is classified as “non-combustible” as determined by ASTM E136 and CAN4-S114. It will not develop toxic smoke or promote flame spread, even when directly exposed to fire, as some other insulation materials do. When tested in accordance with ASTM E84, results typically show a flame spread of 0 and a smoke development of 0. By comparison, spray polyurethane foam (SPUF) results, when tested to ASTM E84, typically achieve a flame of 25 and smoke developed in the 350 to 500 range. ROCKWOOL Cavityrock® and Comfortbatt® stone wool insulation have a melting point of approximately 2150°F (1177°C).

Temperature Development in a Standard Fire (ASTM E119)

Fire Safety: Stone Wool Versus Foam

More recently, as a result of the Shanghai fire in 2010, new concerns have been raised about fire safety during construction. In the case of the Shanghai fire, foam insulation was ignited accidentally during construction and quickly spread through the building exterior. Because of these safety concerns, ROCKWOOL firmly believes in the added value that passive fire resistance provides for buildings.

The severity of the Shanghai fire was partially a result of the use of urethane foam insulation, which aided in the spread of flame and smoke.

Moisture Management

Moisture Retention Comparison
To obtain a better understanding of the characteristics of in situ thermal insulation within cavity walls, a Certified Building Science Expert at ROCKWOOL reviewed two applicable scenarios in Seattle, Washington. The scenarios were modeled for a three-year period and the theoretical wall was located at mid-level of a high-rise on the western elevation. The charts below represent the first modeled scenario. Note that, in this scenario, Cavityrock® had much less moisture content over the same period than XPS foam insulation under the same conditions.

<td>2.16</td>
<td>24.79</td>
</tr>
</tbody>
</table>

Results: Mineral wool insulation in a typical cavity wall will at maximum increase water content from 0.02 kg/m³ to 0.07 kg/m³. XPS had an increase in water content from 0.31 kg/m³ to 0.68 kg/m³.

Ten air changes/hour were included in this calculation.

Double Vapor Barriers can Lead to Moisture Problems
Building enclosures see vapor transport and air movement through the assembly. Although both should be mitigated when designing, air transport will carry higher moisture levels, which could lead to significant moisture problems.

Vapor barriers (retarders) are typically required on the warm side of the assembly (i.e. the interior side for colder climates). As such, the permeability of the insulating materials and the exterior weather resistive barrier/air barrier is critical to avoid the use of double vapor barriers and ensure the wall assembly is able to dry out appropriately.

Vapor Permeability
Cavityrock® and Comfortbatt® are water repellent, yet vapor permeable insulation and will allow transient vapors to pass through without restriction. This vapor permeable quality of ROCKWOOL’s cavity wall insulation allows for an increased potential for drying without trapping water in the wall assembly.

Lower-permeability insulations such as spray foam or XPS can function as vapor retarders and may affect drying potential of typical building assemblies if not designed appropriately.

The stone wool insulation in a cavity wall assembly does not wick water, which means that any bulk water that contacts the outer surface will drain and not be absorbed into the body of the insulation.

*Water content (kg/m³)

Graphs indicate the moisture performance of Cavityrock® over a 3-year timeframe. Cavityrock® dries out year over year to the same levels, indicating that moisture does not build up in the insulation over time.

ROCKWOOL Cavityrock® thermal insulation has a very low moisture vapor sorption and does not permit the horizontal transmission of bulk moisture through the material or the assembly.
Meet the Challenges of Today’s Climate Zones

ASHRAE – History of R-Value Requirements
The American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE) is an international Society of technical individuals who provide knowledge to the building industry on heating, ventilation, air-conditioning, and refrigeration (HVAC&R). The Society developed ASHRAE 90.1, an energy conservation standard that provides the minimum requirements for energy-efficient buildings. This standard, or an equivalent, is applied today in many states for commercial, government and high-rise building applications. In Canada, look to the National Building Code and refer to section A-5.3.1.2 for information on condensation and energy conservation standards.

ASHRAE Map of Climate Zones
Every rating agency has its own maps that divide regions into thermal or climate zones to tailor codes and standards to what is appropriate for that particular region.

*Cavity Insulation = Steel Stud Wall Insulation
At the ROCKWOOL Group, we are committed to enriching the lives of everyone who comes into contact with our solutions. Our expertise is perfectly suited to tackle many of today’s biggest sustainability and development challenges, from energy consumption and noise pollution to fire resilience, water scarcity and flooding. Our range of products reflects the diversity of the world’s needs, while supporting our stakeholders in reducing their own carbon footprint.

Stone wool is a versatile material and forms the basis of all our businesses. With more than 11,000 employees in 39 countries, we are the world leader in stone wool solutions, from building insulation to acoustic ceilings, external cladding systems to horticultural solutions, engineered fibres for industrial use to insulation for the process industry and marine and offshore.
