1. EXECUTIVE SUMMARY

Environmental Resources Management, Inc. (ERM) is conducting an ambient air quality and meteorological monitoring program on behalf of ROCKWOOL in Jefferson County, West Virginia. Monitoring for ambient air quality is being performed on the properties of North Jefferson Elementary School (NJES) and TA Lowery Elementary School (TALES). Meteorological monitoring is being performed on ROCKWOOL’s property.

Currently, ambient concentrations of fine particulate matter with aerodynamic diameters of less than 2.5 micrometers (PM_{2.5}), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), and formaldehyde (CH₂O) are being monitored at each school. This report summarizes the monitoring results for the fourth monitoring quarter of 2022, from October 1, 2022 through December 31, 2022. Measured air pollutant levels were the result of local and distant background emission sources – including production emissions, motor vehicle emissions, biogenic emissions, and windborne dust from agricultural activities. The ROCKWOOL facility began operating on May 22, 2021. This period represents operational air quality conditions.

Figures 1 and 2 illustrate the Air Quality Index (AQI) distribution for each pollutant at the NJES and TALES sites, respectively. All CH₂O, NO₂, and SO₂ concentrations measured for were rated “Good” during this reporting period for both sites.

At NJES, measured values for PM_{2.5} were rated “Good” for 79% of the reporting days and “Moderate” for 21% of the reporting period. Of the 19 “Moderate” category days for PM_{2.5}, two had an AQI value greater than 75. The maximum measured AQI of these “Moderate” days was 98. This day (December 31) was likely influenced by regional accumulation of PM_{2.5} as illustrated by the images retrieved from U.S. EPA’s AirNow archive in Appendix D.

At TALES, PM_{2.5} measurements were rated “Good” for 87% of the days, and the remaining 13% of the days were rated “Moderate” for the reporting period. Of the 12 “Moderate” category days, no days had AQI values greater than 75. The maximum measured AQI of these “Moderate” days was 67. This day (December 21) was influenced by regional accumulation of PM_{2.5} as illustrated by the images retrieved from U.S. EPA’s AirNow archive in Appendix D.

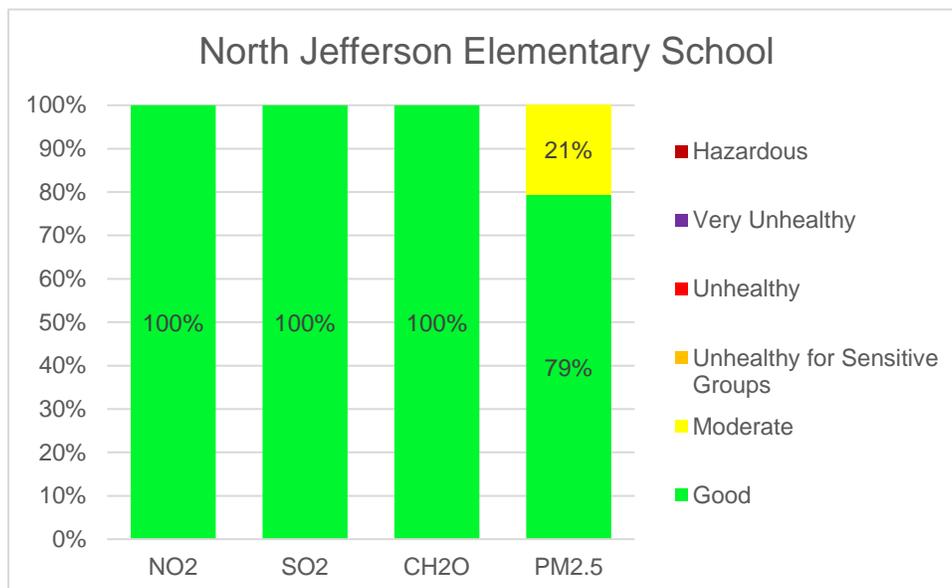

Figure 1: NJES AQI Distribution Summary — October through December 2022

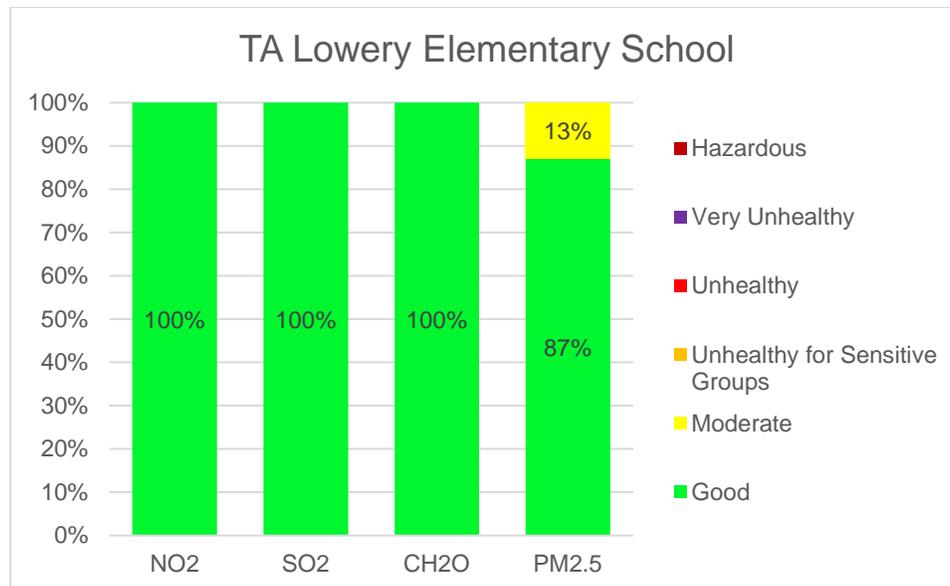

Figure 2: TALES AQI Distribution Summary — October through December 2022

The measured pollutant levels at NJES and TALES are compared with the corresponding guideline values in Tables 1 through 4. U.S. EPA’s National Ambient Air Quality Standards (NAAQS) are used as the guideline concentrations for NO₂, SO₂, and PM_{2.5}. Neither U.S. EPA nor West Virginia have established a standard for CH₂O. Therefore, measured concentrations are compared with the Virginia Department of Environmental Quality (VADEQ) Significant Ambient Air Concentration (SAAC) guideline values. There is no scientific consensus on what is an appropriate long-term health standard for CH₂O. For instance, the Texas Commission on Environmental Quality has set a chronic guideline concentration at 5.5 µg/m³—almost twice the VADEQ value.

During this monitoring quarter, there were no exceedances of a guideline concentration value at either site. For percentile-based guidelines, the concentrations presented in the summary tables are based on the number of valid monitoring days. The eighth-highest concentration values are used for the 98th-percentile parameters (NO₂ and PM_{2.5}) and the fourth-highest concentration values for the 99th-percentile parameter (SO₂).

2. PROGRAM OVERVIEW

The ROCKWOOL facility in Jefferson County has received its air permit to construct and operate the new facility. The facility has been permitted in accordance with all local, state, and federal laws and regulations. To provide additional assurance regarding the facility's environmental safety, ROCKWOOL has voluntarily committed to conducting an ambient air quality monitoring program.

Environmental Resources Management, Inc. (ERM) has been retained by ROCKWOOL to procure, install, operate, and maintain the air monitoring equipment, and to make the air monitoring data publicly available, to inform the community of the local ambient air quality. The program measures ambient air quality that is affected by all emission sources, including the ROCKWOOL facility.

The air monitoring sites are located at North Jefferson Elementary School (NJES) and TA Lowery Elementary School (TALES), as shown in Figure 3. Both locations are within three miles of the ROCKWOOL facility. These locations were selected by ERM based on the following four factors:

- U.S. EPA air quality monitor and meteorological siting criteria,
- The proximity of sensitive populations, such as children, to the ROCKWOOL facility,
- Local wind patterns, and
- An air quality dispersion model analysis.

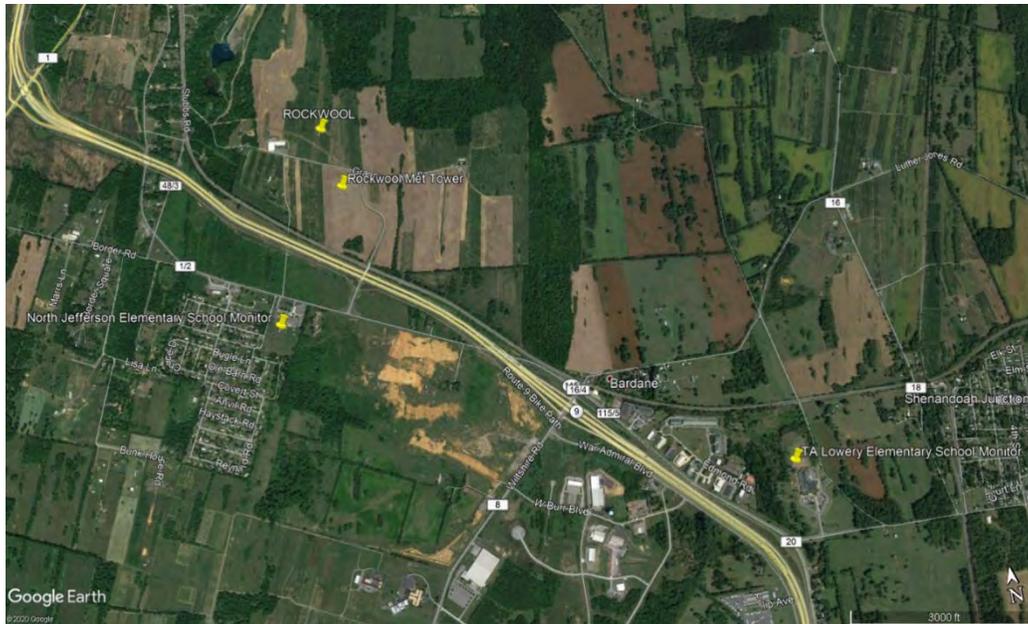

Figure 3: Overhead View of the Monitoring Locations

The monitoring program is continuously measuring ambient concentrations of fine particulate matter (PM_{2.5}), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), and formaldehyde (CH₂O) at both sites. The first three substances were selected for monitoring, because they are U.S. EPA criteria pollutants with federal standards that required a modeling study as part of the air permit application process. Formaldehyde was selected due to it being an air pollutant of specific concern to local residents. There are no West Virginia or federal air standards for CH₂O.

PM_{2.5} is naturally present in the atmosphere. It is directly emitted from natural sources such as volcanoes, wildfires, sea spray, and wind driven suspension of pollen and other fine dust particles. Also, it is formed as the result of complex reactions of gases emitted from natural sources such as volcanoes and wildfires. Human-made sources of PM_{2.5} include construction activities, unpaved roads, open fields, smokestacks, and fires. Human-made sources of secondarily formed PM_{2.5} include combustion of fossil and natural fuels (e.g., wood) in homes, engines, power plants, and industrial plants.

NO₂ is naturally present in the atmosphere, having formed from the chemical reaction of nitric oxide and oxygen. Nitric oxide is naturally emitted from volcanoes, wildfires, and bacterial respiration and is also created from lightning. Human-made sources of NO₂ include combustion of fossil and natural fuels in homes, engines, power plants, and industrial plants.

SO₂ is naturally present in the atmosphere from sources such as volcanoes and wildfires. Human-made sources of SO₂ include combustion of fossil and natural fuels that contain sulfur in homes, engines, power plants, and industrial plants.

CH₂O forms naturally in the atmosphere and during plant decomposition in soil before becoming airborne. Human-made sources of CH₂O include wood burning, vehicle exhaust, particularly engines without catalytic converters, natural gas combustion, and the production or use of CH₂O in manufacturing processes.

A meteorological station capable of continually measuring wind speed and wind direction, along with temperature, humidity, precipitation, and barometric pressure, was installed on ROCKWOOL's property to assist in interpreting the air quality data. A photo of the meteorological station is presented in Figure 4.

Figure 4: ROCKWOOL Meteorological Monitoring Location

The ambient air quality monitoring program commenced at the end of calendar year 2019 and will operate through June 30, 2023. This monitoring period will allow for an assessment of the impact of the facility on the local air quality. Photos of the monitoring locations are provided in Figures 5 and 6.

3. MONITORING RESULTS

This report contains results of the twelfth quarter (October through December 2022) of ambient air quality monitoring. The ROCKWOOL facility was active as of May 22, 2021. Measured air pollutant levels were the result of local and distant background emission sources – including production emissions, motor vehicle emissions, furnace combustion for comfort heating, and windborne dust from agricultural activities.

The following section presents the data for the current reporting period. The Air Quality Index (AQI) summary provides a quick overview of air quality at the monitoring sites, relative to air quality health standards and guidelines. The following air concentrations provide a quantitative comparison of measurements against the established reference criteria. All valid data are tabulated in the appendices.

3.1 Air Quality Index Summary

The AQI is used to report short-term air quality to the public. The AQI relates measured air quality concentrations to their potential health effects. U.S. EPA calculates the AQI for a number of air pollutants, including the PM_{2.5}, SO₂ and NO₂, measured by the ROCKWOOL monitoring program. For each of these pollutants, U.S. EPA has established National Ambient Air Quality Standards (NAAQS) to protect public health. U.S. EPA has not established an ambient standard or AQI for CH₂O. Therefore, ERM used U.S. EPA’s AQI development process and an accepted guideline concentration to devise a project-specific CH₂O AQI approach for the ROCKWOOL program.

The AQI can be visualized as a yardstick that runs from 0 to 500. The higher the AQI value, the greater the level of air pollution, and the greater the health concern. For example, an AQI value of 50 represents good air quality, while an AQI value exceeding 150 represents unhealthy air quality.

An AQI value of 100 generally corresponds to the established health guideline for a pollutant. AQI values below 100 are considered satisfactory. When AQI values are above 100, air quality may be unhealthy – at first for certain sensitive individuals, then for everyone as AQI values get higher. To make the AQI easier to understand, it is divided into six categories:

Air Quality Index	Levels of Health Concern	Colors
<i>When the AQI is in this</i>	<i>..air quality conditions are:</i>	<i>...as symbolized by this color:</i>
0 to 50	Good	Green
51 to 100	Moderate	Yellow
101 to 150	Unhealthy for Sensitive Groups	Orange
151 to 200	Unhealthv	Red
201 to 300	Very Unhealthy	Purple
301 to 500	Hazardous	Maroon

Note: Values above 500 are considered Beyond the AQI. Follow recommendations for the Hazardous category.

Each category corresponds to a different level of health concern. The six levels of health concern and what they mean are described below.

- "Good" AQI is 0 to 50. Air quality is considered satisfactory, and air pollution poses little or no risk.
- "Moderate" AQI is 51 to 100. Air quality is acceptable; however, for some pollutants there may be a moderate health concern for a very small number of people. For example, people who are unusually sensitive to PM_{2.5} may experience respiratory symptoms.
- "Unhealthy for Sensitive Groups" AQI is 101 to 150. Although the general public is not likely to be affected at this AQI range, people with lung disease, older adults and children are at a greater risk from exposure to PM_{2.5}, whereas persons with heart and lung disease, older adults and children are at greater risk from the presence of particles in the air.
- "Unhealthy" AQI is 151 to 200. Everyone may begin to experience some adverse health effects, and members of the sensitive groups may experience more serious effects.
- "Very Unhealthy" AQI is 201 to 300. This would trigger a health alert signifying that everyone may experience more serious health effects.
- "Hazardous" AQI greater than 300. This would trigger health warnings of emergency conditions. The entire population is more likely to be affected.

Ninth quarter monitoring results, expressed in terms of AQI, are presented in the following subsections.

3.1.1 North Jefferson Elementary School

An AQI value was computed daily at NJES for NO₂, SO₂, and CH₂O as long as there was at least one valid hourly measurement recorded by the monitor on that day. The maximum hourly measurement for the monitoring day was used to categorize that day's AQI category.

A daily PM_{2.5} AQI value was computed if 75% (18 hours) of the monitored hours were valid for that day. This is different from the other parameters, since PM_{2.5} is evaluated based on a 24-hour average concentration.

The monitoring results, by AQI index distribution, are summarized in Table 5. For NO₂, SO₂, and PM_{2.5} an AQI value was generated for 92 days of out a possible 92 days of the monitoring quarter. For CH₂O, an AQI value was generated for 91 days out of a possible 92 the monitoring quarter.

For NO₂, SO₂, and CH₂O, all days with a valid hourly measurement fell into the “Good” category. For PM_{2.5}, 73 days fell into the “Good” category and 19 days were characterized as “Moderate”.

Of the 19 “Moderate” category days at NJES for PM_{2.5}, two days had AQI values greater than 75. The maximum measured AQI of these “Moderate” days was 98. These days were influenced by regional accumulation of PM_{2.5} as illustrated by the images retrieved from U.S. EPA’s AirNow archive in Appendix D.

The NJES results for this quarter are illustrated in Figure 7.

For NO₂, SO₂, and CH₂O, all days with a valid hourly measurement fell into the "Good" category. For PM_{2.5}, 80 days fell into the "Good" category, and 12 days were characterized as "Moderate".

Of the 12 “Moderate” category days at TALES for PM_{2.5}, zero days had AQI values greater than 75. The maximum measured AQI of these “Moderate” days was 67. These days were influenced by regional accumulation of PM_{2.5} as illustrated by the images retrieved from U.S. EPA’s AirNow archive in Appendix D.

The results for this monitoring quarter are illustrated in Figure 9.

3.2 Ambient Air Quality Concentrations

Air concentrations are expressed in units of microgram per cubic meter ($\mu\text{g}/\text{m}^3$) – the mass of pollutant present in a standard volume (1 cubic meter – about 35 cubic feet). The air standards or guideline concentrations are expressed in these same units.

Ambient concentrations of NO₂, SO₂, CH₂O, and PM_{2.5} were continuously measured at both monitoring locations. Data were reduced to 1-hour averages for reporting purposes. The number of possible valid data hours for the monitoring quarter was 2,208, which serves as the basis for data recovery statistics. The data recovery percentage is calculated as the number of valid data hours measured divided by 2,208 hours for each parameter. The number of possible valid data days for the monitoring quarter was 92, which serves as the basis for data completeness statistics. The data completeness percentage is calculated as the number of valid days measured (a valid day contains at least 18 valid measurement hours) divided by 92 days.

Occasionally, during periods of particularly clean air, a monitoring instrument may output a slightly negative value – due to normal instrument drift. Agency guidance is to treat such negative concentrations as valid measurements, provided the measurement is greater than the Federal Method Detection Limit, as defined by the U.S. EPA technical note “*Reporting Negative Values for Criteria Pollutant Gaseous Monitors to AQS*”, dated October 6, 2016. This allows for ambient concentrations as low as $-10.5 \mu\text{g}/\text{m}^3$ for SO₂ and $-9.4 \mu\text{g}/\text{m}^3$ for NO₂. Since CH₂O is not a criteria pollutant, no Federal Method Detection Limit exists, and therefore, ERM has elected to apply the limit for NO₂ to CH₂O.

The twelfth-quarter monitoring results, expressed in terms of mass concentrations, are presented in the following subsections.

3.2.1 NO₂

Ambient NO₂ concentration is continuously measured using Thermo Scientific Model 42iQ chemiluminescent analyzers. The 42iQ is a designated Federal Reference Method for measuring NO₂. Concentrations are measured in parts per billion (ppb), then a conversion factor of $1.88 \mu\text{g}/\text{m}^3$ per ppb is applied for reporting purposes.

Table 9 presents the quarterly summary statistics for both monitoring locations. Data recovery and data completeness exceeded the program’s goal of 75% at both monitoring locations. Ambient concentrations of NO₂ measured well below the 1-hour and annual average NAAQS concentrations.

The 1-hour NO₂ NAAQS is evaluated as the 98th percentile maximum daily 1-hour average, averaged over three years. Since only one quarter of data is presented in Table 9, only a comparison against the NAAQS can be performed and not an evaluation. The 98th percentile for the monitoring quarter is presented as the second-highest daily 1-hour average, as defined in 40 CFR Part 50, Appendix S “Interpretation of the Primary National Ambient Air Quality Standards for Oxides of Nitrogen (Nitrogen Dioxide).”

Table 9: Quarterly NO₂ Concentration Summary Statistics

Data Quarter Results October 1, 2022 - December 31, 2022

Table 10 presents the annual summary statistics for both monitoring locations. Data recovery and data completeness exceeded the program’s goal of 75% at both monitoring locations. Ambient concentrations of NO₂ measured well below the 1-hour and annual average NAAQS concentrations. The 98th percentile for the monitoring year is presented as the eighth-highest daily 1-hour average at NJES and the seventh-highest at TALES. The annual average NO₂ concentration is demonstrating compliance with the annual NAAQS. While the 98th percentile concentration is presented and is below the 1-hour NAAQS, the standard requires three years of data to complete a demonstration of compliance. The assessment of the NAAQS will be performed at the conclusion of the monitoring program.

3.2.2 SO₂

Ambient SO₂ concentration is continuously measured using Thermo Scientific Model 43iQ pulsed fluorescence analyzers. The 43iQ is a designated Federal Equivalent Method for measuring SO₂. Concentrations are measured in units of ppb, then a conversion factor of 2.62 µg/m³ per ppb is applied for reporting purposes.

Table 11 presents the quarterly summary statistics for both monitoring locations. Data recovery and data completeness exceeded the program’s goal of 75% at both monitoring locations. Data completeness for the 3-hour average is computed as the percentage of valid 3-hour periods (periods with all three valid hours) relative to the potential 3-hour periods in the monitoring quarter. Ambient concentrations of SO₂ measured were well below the 1-hour and 3-hour NAAQS concentrations.

The 1-hour SO₂ NAAQS is evaluated as the 99th percentile maximum daily 1-hour average, averaged over three years. Since only one quarter of data is presented in Table 11, only a comparison against the NAAQS can be performed and not an evaluation. The 99th percentile concentration for the monitoring quarter is presented as the highest daily 1-hour average, as defined in 40 CFR Part 50, Appendix T “*Interpretation of the Primary National Ambient Air Quality Standards for Oxides of Sulfur (Sulfur Dioxide).*”

Table 12 presents the annual summary statistics for both monitoring locations. Data recovery and data completeness exceeded the program’s goal of 75% at both monitoring locations. Ambient concentrations of SO₂ measured well below the 1-hour and 3-hour average NAAQS. The 99th percentile for the monitoring year is presented as the fourth-highest daily 1-hour average. The 3-hour average SO₂ concentration is demonstrating compliance with the 3-hour NAAQS. While the 99th percentile concentration is presented and is below the 1-hour NAAQS, the standard requires three years of data to complete a demonstration of compliance. The assessment of the NAAQS will be performed at the conclusion of the monitoring program.

3.2.3 CH₂O

Ambient CH₂O concentration is continuously measured using an Aeris Technologies Ultra Series mid-IR laser-based analyzer. Since CH₂O is not a regulated pollutant, U.S. EPA has not certified any instruments as federally-designated methods. Concentrations are measured in units of ppb, and then, a conversion

factor of 1.25 µg/m³ per ppb is applied for reporting purposes. There is no NAAQS or West Virginia standard for CH₂O. Therefore, Significant Ambient Air Concentration (SAAC) values from the Virginia Department of Environmental Quality (VADEQ) are used to guide the CH₂O analysis.

Table 13 presents the quarterly summary statistics for both monitoring locations. Data recovery and completeness goals exceeded the program’s objectives of 75% at both monitoring locations. Ambient concentrations of CH₂O for the quarter measured were well below the 1-hour and annual (12-month average) VADEQ SAAC concentrations at both locations.

There is no scientific consensus on what is an appropriate long-term CH₂O health standard. For instance, the Texas Commission on Environmental Quality has set a chronic guideline concentration at 5.5 µg/m³—almost twice the VADEQ value. In general, average air quality values tend to decrease as the averaging time increases. This is due to the strong influence of highly variable meteorological conditions on measured pollutant concentrations.

3.2.4 PM_{2.5}

Ambient PM_{2.5} concentration is continuously measured by a Teledyne API Model T640 PM Mass Monitor using scattered light spectrometry. The T640 is a designated Federal Equivalent Method for measuring PM_{2.5}. Concentrations are measured in units of µg/m³ – the same units in which the NAAQS is specified.

Table 15 presents the quarterly summary statistics for both monitoring locations. Data recovery and completeness exceeded the program’s goal of 75% at both monitoring locations. Ambient concentrations are below the 24-hour and annual NAAQS concentrations. As described in Section 3.1, the days with the

highest ambient concentrations can be traced to regional events with similarly high concentrations measured at nearby monitors.

The 24-hour PM_{2.5} NAAQS is evaluated as the 98th percentile 24-hour average, averaged over three years. Since only one quarter of data is presented in Table 15, only a comparison against the NAAQS can be performed – not an evaluation. The 98th percentile for the monitoring quarter is presented at the second-highest 24-hour average, as defined in 40 CFR Part 50, Appendix N “*Interpretation of the National Ambient Air Quality Standards for PM_{2.5}*.”

Table 15: Quarterly PM_{2.5} Concentration Summary Statistics

Data Quarter Results October 1, 2022 - December 31, 2022

At NJES, ambient PM_{2.5} concentration is sampled by a Tisch Environmental Wilbur Federal Reference Method low volume sampler – collocated with the Teledyne T640 analyzer. The Wilbur is designated as a FRM-designated method for measuring PM_{2.5} concentrations using a filter medium. The Wilbur operates on the U.S. EPA 1-in-12 day sampling schedule to collect reference concentrations with which to evaluate the precision of the continuous PM_{2.5} measurements.

Appendix C presents the results of the samples collected by the Wilbur. The precision of the PM_{2.5} measurements is assessed by calculating the coefficient of variation between the two sampling methods when both methods produce concentrations greater than or equal to 3.0 µg/m³. The coefficient of variation for this monitoring quarter was 13.6%. This deviation from the goal is not uncommon when comparing Federal Equivalent Method (FEM) and Federal Reference Method (FRM) measurements of PM_{2.5} due to the effects of relative humidity and volatilization of collected particles on measurements.

Table 16 presents the annual summary statistics for both monitoring locations. Data recovery and data completeness exceeded the program’s goal of 75% at both monitoring locations. Ambient concentrations of PM_{2.5} were well below the 24-hour and annual average NAAQS concentrations. The 98th percentile for the monitoring year is presented as the eighth-highest 24-hour average. While the 98th percentile and annual average concentrations are presented and are below the 24-hour and annual NAAQS, the standards require three years of data to complete a demonstration of compliance. With the completion of the twelfth monitoring quarter, three years of data are present, however, a NAAQS assessment will not be included in this report. The NAAQS assessment will be performed at the conclusion of the monitoring program.

The coefficient of variation for this monitoring year was 14.2%. This deviation from the goal is not uncommon when comparing Federal Equivalent Method (FEM) and Federal Reference Method (FRM) measurements of PM_{2.5} due to the effects of relative humidity and volatilization of collected particles on measurements.

3.3 Meteorological Measurements

The on-site meteorological monitoring system was installed on June 12, 2020 and, outside of routine maintenance and calibrations, has since been operating continuously. The parameters and instruments installed consist of:

- Wind speed and direction is measured at the ten-meter level by an RM Young Model 05305 mechanical anemometer;
- Standard deviation of wind direction, sigma theta, is calculated by the Campbell Scientific CR1000 data logger;
- Ambient temperature is measured at the two-meter elevation by an Apogee Instruments Model ST-100 thermistor;
- Relative humidity is measured at the two-meter elevation by a Vaisala HMP-60 hygrometer; and
- Rainfall is measured by an RM Young 52203 tipping bucket precipitation gauge.

Summary statistics for the monitoring quarter are presented in Table 17. Table 18 presents the meteorological summary statistics for the monitoring year.

4. DATA VALIDATION

Each site's data logger was remotely polled on a regular basis by an air quality specialist, and the data were stored in a dedicated database. Data validity was evaluated using nightly zero and span results,

weekly precision check results, multi-point assessments of the analyzers, flow verifications, and shelter temperature. The evaluation criteria for data validation are specified in the Quality Assurance Project Plan (QAPP). All data validation assessments were found to be within the target acceptance criteria, data recovery, and completeness percentages exceeded goals for all parameters.

4.1 Precision and Bias Statistics

Precision and bias statistics for NO₂, SO₂, and CH₂O for this monitoring quarter were calculated from weekly challenge concentration responses. The bias value presented in the table can be negative, positive, or unsigned. Signing the bias provides an indication of the performance of the analyzer relative to its expected value. When the bias is unsigned, the analyzer’s performance was not consistently above or below its expected value. The results of the calculations demonstrate that each analyzer was performing well within the acceptance criteria for each statistic.

Table 19 presents the observed concentrations and target values for each weekly challenge of the analyzers at NJES. Table 20 presents the calculated quarterly precision and bias values for each of the monitored parameters at NJES. Table 21 presents the calculated annual precision and bias values for each of the monitored parameters at NJES. The results of the annual calculations demonstrate that each analyzer was performing well within the acceptance criteria for each statistic.

Table 22 presents the observed concentrations and target values for each weekly challenge of the analyzers at TALES. Table 23 presents the calculated quarterly precision and bias values for each of the monitored parameters at TALES. The results of the calculations demonstrate that each analyzer was performing well within the acceptance criteria for each statistic. Table 24 presents the calculated annual precision and bias values for each of the monitored parameters at TALES. The results of the annual calculations demonstrate that each analyzer was performing well within the acceptance criteria for each statistic.

4.2 Third-party Audits

On November 30, 2022, a Performance Evaluation Program (PEP) audit was performed at NJES. The results of the audit can be found in Appendix E. The measured concentrations during the audit were low, amplifying the percent difference between the audit sampler and the site sampler. The measured percent difference was 36.7% for the audit. As with previous audit results, it is believed that some particulates are volatilized off the audit filter before they are measured. These particulates are captured by the optical sensor of the site sampler.

On December 1, 2022, a Through the Probe (TTP) audit was performed at NJES on the NO₂ analyzer. The NO₂ analyzer passed the audit, as found in the audit report in Appendix E.

Table 25 presents the results of all Performance Evaluation Program (PEP) audits performed for the monitoring year. The calculated bias between the FEM units and the audit sampler was +50.2% for the monitoring year. As described previously, significant differences can arise between PM_{2.5} FRM and FEM sampling methods. The PM_{2.5} samplers deployed for the ROCKWOOL program utilized optical sensing to measure ambient concentrations. This method can count particles that may otherwise volatilize from a FRM filter sample, leading to a positive bias.

1.0 Introduction

Environmental, Engineering & Measurement Services, Inc. (EEMS) was contracted by Environmental Resources Management, Inc. (ERM) to conduct audits of the Rockwool air quality monitoring network located near the small town of Ranson, WV. The purpose of this network is to partner with the local community and inform stakeholders and residents to potential air quality issues due to the construction and operation of the Rockwool plant which produces mineral wool insulation. Operation of the air quality monitoring network is voluntary and intended to ensure the wellbeing of the nearby sensitive population, including elementary school students.

Currently the monitoring network consists of two stations, and is operated by ERM on behalf of Rockwool. The operation of the monitoring network meets the requirements in Appendix B to 40 CFR Part 58. Rockwool requires that this monitoring network be audited following the National Performance Audit Program (NPAP) and the Performance Evaluation Program (PEP) as is required of State and Local Air Monitoring Stations (SLAMS) by the U.S. EPA.

The NPAP is a quality assurance (QA) program implemented by the EPA Office of Air Quality Planning and Standards (OAQPS) to conduct audits of air pollutant monitors by standard methods throughout each region of the U.S. The method includes introduction of National Institute of Standards and Technology (NIST) traceable audit gases to the station monitors through the ambient sample inlet, or through-the-probe (TTP), including all filters and fittings. This method evaluates measurement system accuracy including the entire sample train. The audit gas concentrations are also measured and verified with an audit analyzer on-site which is calibrated at the time of the audit.

The PEP is a QA activity used to evaluate measurement system bias of the PM_{2.5} monitoring network. This is accomplished by co-locating a portable FRM PM_{2.5} air-sampling instrument with the station air-monitoring instrument, operating both samplers, and comparing the results.

EEMS performed the TTP and PM_{2.5} PEP audit at the Rockwool network North Jefferson Elementary School (NJES) site, following EPA's Quality Assurance Guidance Document – Method Compendium – Field Standard Operating Procedures (SOP) for the Federal PM_{2.5} Performance Evaluation Program and NPAP TTP Audit SOP. This report includes the results of the audits conducted on December 1, 2022.

The NJES monitoring site is located at 6996 Charles Town Road, Kearneysville, in Jefferson County, WV. Map images of the site are included in Appendix B. The monitoring site coordinates are provided in Table 1 and an image of the station is included as Figure 1 below.

Section 3.0	Audit Results
Appendix A	Audit Data Sheets and Laboratory Results
Appendix B	Maps of Locations
Appendix C	Audit Standards Certifications

The preparation of this report, and all the activities and tasks described in this report, were performed by an accredited NPAP-TTP/PEP mobile lab Field Scientist. All procedures followed during the audits were provided by OAQPS and are available at the OAQPS website: <https://www3.epa.gov/ttn/amtic/npepqa.html>.

Appendix C includes copies of the NIST-traceable certifications of the audit standards.

2.0 Audit Methods and Equipment

This section describes the steps followed in the performance of these audits. EEMS followed the document referenced above rigorously. Supplemental guidance and excerpts from the method can be found at <https://www3.epa.gov/ttn/amtic/npepqa.html>

2.1 Laboratory Activities Prior to the Field Activities

Filters for the PEP audit were pre-weighed and supplied by Pace Analytical (Pace) located in Sheridan, WY. The procedures for micro-gravimetric analysis for PM_{2.5} pre- and post- exposure were followed as described in CFR 40 part 50 Appendix L. Additional information regarding the methods can be found at: <http://www.epa.gov/ttn/amtic/files/ambient/pm25/qa/m212covid.pdf>.

The filters were shipped to EEMS properly labeled, and with the appropriate chain-of-custody documentation. The filters were used by EEMS within the prescribed amount of time, stored at less than 4 °C and returned to Pace for post-exposure analysis within the prescribed time for SLAMS monitoring.

2.2 Certification of EEMS Standards

All standards owned and maintained by EEMS undergo annual NIST-traceable certification. The standards include EPA Protocol Gas standards, digital multi-meters, meteorological sensors and standards, and various flow rate measurement systems including DeltaCal devices. Copies of the annual certifications of the EEMS standards used for these audits are included in Appendix C.

2.3 FRM Portable Audit Sampler

EEMS owns and operates three BGI PQ200A portable PM_{2.5} samplers and DeltaCal flow rate verification/calibration devices. For this audit the sampler used was serial number 90003. The flow rate standard device used was a BGI DeltaCal, EEMS number 01453. All standard flow rate measurement devices are returned to the manufacturer each year for annual maintenance and certification. EEMS participates in the EPA PM-sampler co-location evaluations, and the NPAP training and certification classes. The portable samplers are calibrated twice annually during the co-location evaluations.

Most recently, EEMS participated in the three-day PM sampler co-location evaluation test at the EPA Region 4 laboratory in January 2022, in Athens, GA. The available results of the EEMS sampler comparisons are included in Appendix C with the most recent NPAP-TTP and PEP annual training and recertification Field Scientist Accreditation.

2.4 EPA Protocol Gas Standards and EEMS Mobile Laboratory

EEMS owns and maintains a Thermo Environmental Instruments Inc. (TEI) 48i TLE CO analyzer which is used to verify standard audit gas concentrations during TTP audits. The CO analyzer is mounted and operated in a climate controlled mobile laboratory with a multi-gas dilution system and NIST-traceable EPA Protocol Gas standards. The NIST-traceable gases include cylinders of high concentration CO, low concentration CO, and a multi-blend NO, CO, SO₂ mixture. The mobile laboratory is equipped with its own data acquisition system (DAS). An image of the EEMS mobile laboratory is included in Figure 2.

The system is verified by the EPA Region 7 Laboratory every other year. The NIST-traceable certification from the gas standards supplier, and the most recent verification and certification from the Region 7 lab are included in Appendix C.

2.5 Field Activities

On Tuesday, November 29, EEMS personnel met ERM personnel at the facility and the portable PQ200A audit sampler was co-located with the FRM sampler at the station. The portable audit sampler was assembled and set up on the ground with inlet extensions. The PEP sampler inlet was positioned between 1 to 4 meters from the site's sampler inlets.

The audit sampler was leak tested, and the measured flow rate, temperatures, and barometric pressure were compared to the standard audit device. All comparisons were within PEP audit

acceptance criteria. The instrument time and date were set, and it was programmed to run from midnight to midnight on Wednesday, November 30.

An image of the PEP audit sampler installation at the NJES site is provided below in Figure 3.

Figure 3. Rockwool NJES PEP Audit Configuration

On Thursday, December 1, EEMS personnel returned to the NJES station to remove the exposed PEP sample. The sampler data were downloaded and reviewed to ensure a valid run had occurred. The portable audit sampler was disassembled, and packed. The station FRM sampler operational parameters were verified with the EEMS standard after removing the audit sampler.

Also, on Thursday the TTP audit of the NO_x monitor was performed. Field activities were concluded the afternoon of the 12/1/2022.

2.5.1 Performance Verification of Audit PM Sampler

Performance verifications of the audit PM sampler were performed following the manufacturer's recommendations along with Section 5.0 of the Field Standard Operating Procedures for the Federal PM_{2.5} Performance Evaluation Program the day preceding the PEP audit sample collection at the site. The results of those verifications prior to the site audit are included in Table 3. The

summary data recorded by the PEP sampler during the 24-hour PEP sample collection are also included in the table.

The DeltaCal flow rate standard device used to perform the verifications was certified by the manufacturer on 8/31/2022. A copy of the NIST-traceable certification is included in Appendix C.

2.5.2 Filter Installation

After the audit sampler was assembled and the pre-audit verifications were completed as described above and according to the manufacturer’s and SOP recommendations, EEMS personnel used gloves to install the field blank and PEP sample cassettes in the sampler. A Field Blank was installed in the sampler prior to the audit filter. The sampler was not operated with the Field Blank in place. The Field Blank was removed a few seconds after installing and then the audit sample filter cassette was installed. The filter and cassette were examined for defects before installing.

A Trip Blank, which was not removed from the anti-static bag, was included with the cooler, field blank, and the PEP audit sample.

2.5.3 Sample Retrieval, Data Download and Shipping

At approximately 8:30 am the day following the audit sample collection, the PEP sampler was opened and the audit sample was removed with clean, powder-free, gloved hands. Summary data were reviewed from the PQ200A display to ensure completeness and that a valid sample run had occurred. Data were downloaded from the PQ200A and were included with the PEP filter in order to calculate concentration.

The sample chain-of-custody form was completed and the PEP sample, Field Blank and Trip Blank, were kept below 4 °C and sent to the Pace lab for post-exposure analyses.

2.5.4 Gaseous Pollutant Monitor Audits

The EEMS mobile laboratory audit analyzers and systems were allowed to warm-up for at least 48 hours prior to the station audit.

All monitor sample pressures and flow rates were checked prior to, and following the introduction of audit gas to ensure that changes to the routine sampling variables did not occur as a result of the addition of audit gas (test atmosphere) to the sampling inlet.

To be equivalent to the NPAP, an annual performance evaluation (PE) requires that the station monitor be challenged (TTP) with audit gas standards of known concentration from at least three approved audit levels, and verified with an audit standard. The NPAP requires challenges at levels 3, 4, and 5, and recommends a challenge at level 1 or 2. The selected audit levels for the PE should be defined in the Quality Assurance Project Plan (QAPP) developed by the Primary Quality Assurance Organization (PQAO) responsible for managing the monitoring network. The QAPP must be approved by the state or federal authority responsible for oversight of the program.

The compliance of audit levels with federal regulations and guidelines should be determined during the routine Technical Systems Audits (TSA) performed by the oversight authority. It is not the responsibility of the EEMS field scientist to select audit levels. The field scientist relies on the station manager to select the audit levels since the station manager is familiar with the QAPP and the concentrations measured at the monitoring station. In general, the audit levels should be representative of the measured ambient concentrations to be equivalent to the federal NPAP. Table 5 provides the approved list of audit levels. The final results of the TTP PE audits are included in Section 3.0.

2.5.5 Specific NO₂, Audit Activities

Prior to beginning the NO_x audit, the EEMS audit CO analyzer was calibrated using zero air system and CO gases. This was accomplished by supplying the EEMS mobile laboratory CO analyzer with NIST-traceable gas directly from the cylinders and not through the mobile lab dilution system. Data from this “Pre-audit” calibration was entered into the OAQPS audit spreadsheet to be used to calculate the concentration of all audit gases generated during the station audits.

The site audits were accomplished by generating audit test gas using the mobile laboratory dilution system and the NIST-traceable multi-blend gas. The audit gas was delivered to the station monitors at the station sample inlet, through all filters and fittings using Teflon tubing and Tee fittings to allow the audit gas to vent at the inlet. The generated audit gas CO concentrations were verified with the mobile laboratory CO analyzer. The other audit gas concentrations were then calculated based on the ratio of CO to the other gases in the NIST-traceable multi-blend audit gas cylinder.

Immediately following the station audits, the mobile laboratory CO analyzer was again challenged directly with the NIST-traceable cylinder gases. The results of this “Post-audit” challenge were entered into the OAQPS spreadsheet to correct the audit standard gas concentrations, accounting for any drift of the mobile laboratory CO analyzer. This procedure (Pre-audit CO calibration, multipoint station audits, and Post-audit CO challenge) is the same OAQPS standard procedure used routinely for all NPAP-TTP audits.

3.0 Audit Results

3.1 PEP Results

Micro-gravimetric results of the PEP audit sample, station FRM sample, and the daily average of the T640 PM_{2.5} concentration as measured by the site FEM, are provided in Table 6. The concentrations measured by the site instruments were provided by ERM.

Table 6. Rockwool NJES PEP Audit Results

Site Sampler and Date	24-hour PEP Audit Value (µg/m3)	Site Sampler Value (µg/m3)	Actual Difference (µg/m3)	% Difference
FEM --- 11/30/2022	3.0	4.1	1.1	36.7 %
FRM --- 11/30/2022		3.4	0.4	13.3 %

The PEP procedure requires that the ambient concentration be above 3.0 µg/m³ for the audit to be considered valid for statistical analysis. That criterion was met for this PEP audit. That requirement is being evaluated by the EPA. A note from Section 6.4 Schedule of Activities of the Quality Assurance Project Plan (QAPP) for the PEP is included below. In addition, there are ongoing discussions at OAQPS regarding changing the difference comparison to actual difference rather than percent difference for comparison when concentrations are less than 5.0 µg/m³.

NOTE: Sites that have seasonally low concentrations should be sampled during times when concentrations are expected to be greater than 3 µg/m³. EPA recognizes that it may be difficult or impossible to obtain valid audits at sites where the concentration rarely exceeds 3 µg/m³. EPA is currently considering ways to evaluate such sites. Audits that are otherwise valid, but do not meet the “greater than 3 µg/m³” criteria, are still useful to evaluate sampler operation, even if such audit data may not be used in the calculations for sampler bias.

The agreement between the site FEM sampler and the PEP sampler is good with a difference of approximately 1.0 µg/m³ for the PEP audit. The agreement between the site FRM sampler and the PEP sampler is better with a difference of < 0.5 µg/m³. The concentration measured was very low and the percent difference of a low concentration can be misleading.

It should be noted that the NPAP PEP QAPP states that the detection limit of the PEP audit sampler is 2.0 µg/m³ and the manufacturer states that the accuracy is ± 1.0 µg/m³. The laboratory data sheets with blank results and replicate results are included in Appendix A.

3.2 TTP Nitrogen Dioxide Audit Results

The NO_x monitor was audited using the gas phase titration (GPT) method with ozone to produce NO₂. Audit results for the monitor were within the acceptance limits of ± 15% for any audit point. The concentration measured by the site monitor was consistently lower than the actual concentration, and above the warning limit of ±10% at some points. The results of the NO₂ audits are summarized in Table 7. The field audit forms are included in Appendix A.

Note: These flow rate audits were performed at the specific laboratory conditions of temperature and pressure. Each individual sensor was not audited, only the values read directly from the instrument, as indicated above. This audit should not be construed as a comprehensive system audit, as individual sensors were not challenged through the full operating range.
